

This report documents the firewall configuration steps performed using UFW on Kali Linux. The firewall was installed and enabled, existing rules were listed, and an inbound block rule was added for port 23 (Telnet). The rule was tested using a Telnet connection attempt, which correctly returned 'connection refused'. SSH on port 22 was allowed to ensure access remains available. Finally, the Telnet block rule was removed to restore the firewall to its original state. Screenshots were taken to verify each step.
